

Delegation rate by MC-entropy quartile — SimpleMC

Delegation rate by MC-entropy quartile — TriviaMC

Splits the delegation decisions by the model's internal entropy on the MC question: bottom quartile (most confident) vs top quartile (most uncertain). An introspective model should delegate MORE in the high-entropy (red) bars than in the low-entropy (blue) bars. A flat profile (red $\approx$ blue) means delegation decisions ignore the model's own uncertainty.
