

Delegation game — all available (model, dataset) combos

Each panel annotates whether ↑ or ↓ is better. Bars grouped by model; colored by dataset. On acc_answered: dashed segment = acc_all (if bar > dash, selective answering helped). On team_score: dashed = always-answer baseline; dotted = always-delegate baseline (= teammate_acc). Digit skew panel exposes positional bias — values near 100% mean the model picks one digit every time, making the delegate rate a prompt-format artifact rather than a metacognitive signal.
